

MSM KURUKA UNIT

WEBSITE HOSTING & SETUP GUIDE

Complete step-by-step instructions to set up your Firebase backend and deploy the website so all members can share data in real-time.

- Free hosting — website accessible from anywhere
- Real-time shared database — all users see the same data
- Secure login for Super Admin and Admins
- Email-based password reset (completely free)
- Works on mobile, tablet, and computer

What you need:

- A Google account (Gmail) · ■ A computer with internet · ■ About 30 minutes

Cost: Completely FREE. Firebase free tier is more than enough for this organisation.

HOW IT WORKS

Your website uses **Firebase** — Google's free cloud service. Firebase stores all your data (members, finances, admins) in the cloud. Every person who opens the website sees the same data in real-time.

Your Computer / Phone

Firebase (Google Cloud)

All Users See Same Data

1

Create a Firebase Project

1.1 Open your browser and go to:

console.firebase.google.com

1.2 Sign in with your Google / Gmail account.

1.3 Click the big "+ Add project" button.

Field	What to enter
Project name	msm-kuruka-unit (or any name you like)
Google Analytics	Click "Continue" — Analytics can be turned OFF
Confirm	Click "Create project" — wait about 30 seconds

2

Enable Authentication (Login System)

This lets users log in to the website.

- 2.1 In the left sidebar, click "Authentication"
- 2.2 Click the "Get started" button
- 2.3 Click on "Email/Password" (first option in the list)
- 2.4 Toggle "Enable" to ON (blue)
- 2.5 Click "Save"

Authentication is now active. This allows Super Admin and Admins to login securely. Password reset emails will work automatically through Firebase.

3

Enable Firestore Database (Data Storage)

Firestore is where all your data (members, finances, admins) is stored in the cloud.

- 3.1 In the left sidebar, click "Firestore Database"
- 3.2 Click "Create database"
- 3.3 Choose "Start in test mode" — click "Next"
- 3.4 Choose a location — select "asia-south1 (Mumbai)" for best speed in India
- 3.5 Click "Enable" — wait about 1 minute

IMPORTANT — Secure Your Database:
After setup, go to Firestore > Rules tab and replace the content with the security rules shown in Step 6 of this guide.

4

Get Your Firebase Configuration Code

This code connects your website to your Firebase project. You will copy-paste it into the HTML file.

- 4.1 Click the gear icon ■ next to "Project Overview" in the left sidebar
- 4.2 Click "Project settings"
- 4.3 Scroll down to the "Your apps" section

- 4.4 Click the "" (Web) icon to register a web app
- 4.5 In "App nickname", type: MSM Web App — then click "Register app"
- 4.6 You will see a code block. Look for the part that starts with "const firebaseConfig = {"
- 4.7 Copy everything from the opening { to the closing } — this is your config

Your config will look like this (with YOUR actual values):

```
{
  apiKey: "AIzaSyABCDEFGHijklmn...",
  authDomain: "msm-kuruka-unit.firebaseio.com",
  projectId: "msm-kuruka-unit",
  storageBucket: "msm-kuruka-unit.appspot.com",
  messagingSenderId: "123456789012",
  appId: "1:123456789012:web:abcdef123456"
}
```

5 Paste the Config into the HTML File

- 5.1 Open the file "msm_kuruka_firebase.html" in a text editor
(Right-click the file → Open with → Notepad OR use VS Code)
- 5.2 Press Ctrl+F (Find) and search for: PASTE YOUR FIREBASE CONFIG HERE
- 5.3 Find the section below that line that says:
const FIREBASE_CONFIG = {
 apiKey: "",
 authDomain: "",
 ...etc
- 5.4 Replace the entire { ... } block with the config you copied in Step 4
- 5.5 Save the file (Ctrl+S)

 TIP: You can test locally first! Open the HTML file directly in Chrome (double-click it).
If it shows the Setup Wizard, your Firebase config is working correctly.

6 Set Firestore Security Rules

Security rules protect your data so only logged-in users can access it.

- 6.1 In Firebase Console, go to Firestore Database → Rules tab
- 6.2 Delete all the existing text in the rules editor
- 6.3 Copy and paste the rules below
- 6.4 Click "Publish"

```
rules_version = '2';
service cloud.firestore {
  match /databases/{database}/documents {
```

```
// Allow authenticated users to read/write all data
match /{document=**} {
  allow read, write: if request.auth != null;
}
// Config readable by all to show org name on login page
match /config/settings {
  allow read: if true;
  allow write: if request.auth != null;
}
}
```

7

Host Your Website (Free on Netlify)

Netlify is the easiest free hosting — just drag and drop your HTML file. No installation needed.

- 7.1 Go to app.netlify.com in your browser
- 7.2 Sign up for free (use Google or email)
- 7.3 On the dashboard, scroll down to see "Deploy manually" section
- 7.4 Drag your "msm_kuruka_firebase.html" file and DROP IT into the deploy box
- 7.5 Wait 10-20 seconds — Netlify will give you a link like: <https://amazing-name-123.netlify.app>
- 7.6 Open that link — you should see your website!
- 7.7 Optional: Click "Domain settings" to set a custom name like msm-kuruka.netlify.app

Your website is now LIVE! Share the Netlify link with your admins and members.
Any data added by anyone will instantly be visible to everyone.

8

First Login — Setup Wizard

The first time you open the website, a Setup Wizard will appear.

- 8.1 Open your website link in the browser
- 8.2 You will see the Setup Wizard — Upload your organisation logo (optional)
- 8.3 Enter Organisation Name: MSM KURUKA UNIT
- 8.4 Enter Super Admin name, mobile number, and email
- 8.5 Create a strong password (min 6 characters)
- 8.6 Click "Launch Portal" — your account is created!
- 8.7 You are now logged in as Super Admin

HOW TO ADD ADMINS / FRIENDS

- Step 1** Login as Super Admin
- Step 2** Go to "Admin Accounts" tab in the sidebar
- Step 3** Click "+ Create Admin"
- Step 4** Enter their name, email, and a temporary password
- Step 5** Turn ON the permissions they need (View Members, Add Finance, etc.)
- Step 6** Choose which Programmes they can add transactions to
- Step 7** When prompt appears, enter YOUR Super Admin password to confirm
- Step 8** Their account is created! Share the website link and their email+password with them
- Step 9** They can reset their password anytime using "Forgot Password" on the login page

FIREBASE FREE TIER LIMITS

Firebase free tier (Spark plan) is very generous. For a typical organisation this will never be exceeded:

Feature	Free Limit	Typical Usage
Firestore Reads	50,000/day	More than enough
Firestore Writes	20,000/day	Plenty for daily use
Firestore Storage	1 GB free	Could store ~500,000 members
Authentication Users	Unlimited	No limit
Hosting (Netlify)	Unlimited	No limit
Password Reset Emails	Unlimited	Free always

COMMON PROBLEMS & SOLUTIONS

Problem: Website shows "Firebase Setup Required"

Solution: The config was not pasted correctly. Open the HTML in Notepad, find `FIREBASE_CONFIG = {` and make sure your config is pasted inside the curly braces with all values filled in.

Problem: "Permission denied" error when adding data

Solution: Firestore security rules have expired. Go to Firebase Console → Firestore → Rules and publish the rules from Step 6 again.

Problem: Cannot login after creating admin

Solution: Make sure the admin uses the exact email you entered. Passwords are case-sensitive. Use "Forgot Password" to reset.

Problem: Website link not working after update

Solution: You need to re-upload the HTML file to Netlify every time you update it. Go to app.netlify.com, open your site, and drag-drop the new file.

Problem: Logo not showing for other users

Solution: The logo is saved in Firebase and shared automatically. If it's not showing, try clearing browser cache (Ctrl+Shift+Delete).

Problem: Data not syncing between users

Solution: Check internet connection. Firebase requires internet to sync. Data saved offline will sync when connection is restored.
